Evaluation of Ground Tire Rubber in Asphalt Binders and Mixtures

NCAT PG Results

Rubber Product	Dosage Rate, %	True Grade	Performance Grade
-30 Liberty	10%	80.7 – 23.6	76 – 22
-20 Liberty	10%	83.1 – 24.6	82 – 22
-20 Liberty	15%	87.9 – 21.3	82 – 16
Crackermill	10%	82.8 – 23.1	82 – 22
Cryo-Hammer	10%	82.2 – 23.2	82 – 22
Cryo-Hammer	15%	86.7 – 19.3	82 – 16
-30 Liberty Fines	10%	79.8 – 20.4	76 – 16
-16 Powderizers (1mm gap)	10%	76.3 – 21.8	76 – 16
-16 Powderizers (2 mm gap)	10%	84.7 – 21.8	82 – 16
Virgin Binder		69.2 – 24.7	67 - 22

RTR Alternative Modifier

- About 3 x RTR loading is needed compared to SBS for similar properties.
 - Example: 3% SBS content = 9% RTR Content
- Suppose SBS costs \$2.00/Pound and RTR Costs \$0.50/Pound
 - Example:
 - 3 Pounds SBS = \$6.00,
 - 9 Pounds RTR = \$4.50
- Project with 1000 Tons of Modified of Binder
 - SBS at 3% = 30 Tons Needed @ \$2.00 = \$120,000
 - RTR at 9% = 90 Tons Needed @ \$0.50 = \$90,000

AASHTO CHANGES

- M320 – PG Asphalts, allow modifiers, particulate 600 microns in size (30 mesh)
- T44 – Solubility Test
- MP19 – PG Asphalt using MSCR
- T315 – The DSR, 2 mm gap

A Change in Acceptance Testing

- In 2008, a substantial price spike in asphalt costs struck the paving industry nationwide.
- The use of Reclaimed Asphalt Pavement and Recycled Asphalt Shingles increased to solve the problem of high asphalt costs.
- The performance of RAP and RAS is measured through mix tests, not the liquid binder.
- This is a significant opportunity for Recycled Tire Rubber, as long as it costs less than asphalt and does not increase the liquid requirement (add cost) at the asphalt mix plant.

Mix Performance Tests Are More Common with the Use of RAP and RAS

New “Dry Process”

- Research Published at the LTRC, (Sam Cooper and Louay Mohammad), work underway at several Universities and with-in suppliers to the asphalt industry
- Rubber particles pre-treated with useful liquids before packaging, or co-packaged with low melt processing aids or powders before delivery to mix plant
- GA DOT using a co-packaged “Plant Mix” rubber

Rubberized Asphalt Can Be Recycled

- Most Rubber Projects are still performing and do not need to be recycled.
- Over eight agencies have reported successful recycling projects at 15% or greater rubber Reclaimed Asphalt Pavement.

Rubberized Asphalt Performs Better,
Saves Money, and is Sustainable

Hypothesis

- Rubber crumbs may function as a distribution of mini expansion / control joints inside the concrete.
- Thus, the crumb rubber concrete may exhibit good characteristics in controlling crack initiation and propagation.

Field Experiments

- Feb 1999, ASU sidewalk, 40 lbs.
- June 2001, ASU wheel chair ramp, 20 lbs.
- May 2001, ADOT parking lot, 60 lbs.
- March 2002, residential patio foundation in Mesa AZ, 20 cr/cy.
- April 2002, NAU campus (cold climate), 60 lbs
- March 2003, residential sidewalk in Scottsdale, AZ, 25 lbs.

Tennis Court – Phoenix, AZ

- At Hanson's Aggregates in Phoenix, AZ:
 - test slab 5 x 25 feet and 2 inches thick
 - 400 lbs of cr/cy, 25% of the concrete mix by volume
 - was placed without any joints
 - slab serves as a truck parking facility
 - no cracks have been observed as of 2006
 - provided useful experience about mixing, hauling, pumping, placing, finishing, and curing of crumb rubber concrete.

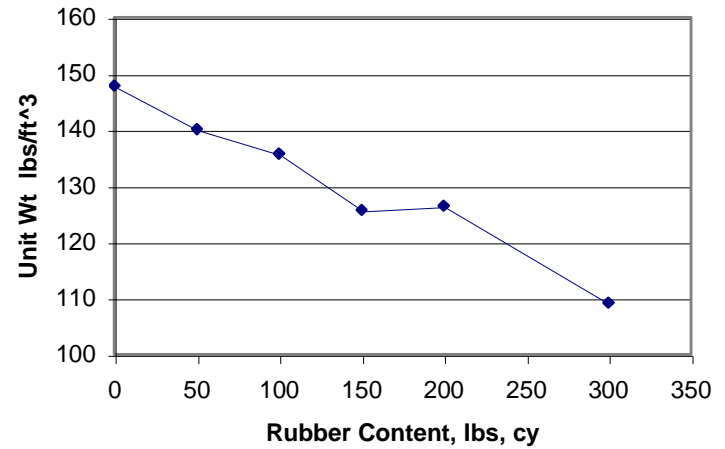

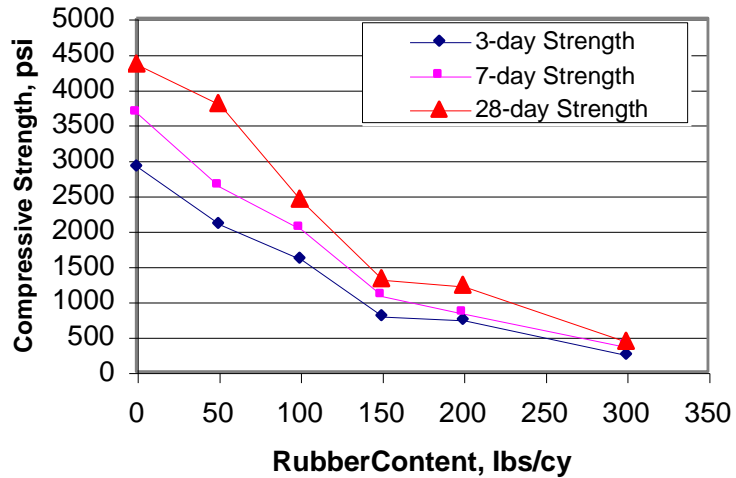

Tennis Court – Phoenix, AZ

- January 2003:
experimental test slabs
 - 2x4 ft in size
 - thickness 2 - 3 inches
 - 50 >-> 300 cr/cy.
- Tests included:
compressive strength,
flexural strength, indirect
tensile strength, and
thermal coefficient of
expansion.

Court Mix**

CTE Comparison

The distresses are a function of the CTE values
Lower values of CTE in the mix results in less faulting, lower percentage of cracking.

Conclusions

- Advantage of unit weight reduction with increased crumb rubber content.
- Entrapped air and very high rubber content contribute to compressive strength reduction. However, higher strength values are achievable depending on design requirements.
- Similarly, flexural strength reduction may be compensated for by higher ductility and comparable toughness.
- Higher tensile strain at failure for CRC mixes is indicative of higher energy absorbent mixes and less prone to shatter.
- CTE results indicated that CRC mixes are more resistant to thermal changes.

Final Thoughts

- Performance monitoring is needed to validate durability and mix characteristics.
- There are advantages and disadvantages for the use of CR PCC, careful consideration should be given for each design case.
- Improved mixture characteristics are possible through mix optimization. Watch for entrapped air.
- Crumb rubber content is also specific for mix usage or application.
