Performance Program

ASTM Designation: D6433 - 11

Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys¹

This standard is listed under the final designation D6433; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last revision. A superscript (x) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers the determination of roads and parking lots pavement condition through visual surveys using the Pavement Condition Index (PCI) method of quantifying pavement condition.

1.2 The PCI for roads and parking lots was developed by the U.S. Army Corps of Engineers (1, 2).² It is further verified and adopted by DOD and APWA.

1.3 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. Specific precautionary statements are given in Section 6.

2. Terminology

2.1 Definitions of Terms Specific to This Standard:

2.1.1 **additional sample**—a sample unit inspected in addition to the random sample units to include nonrepresentative sample units in the determination of the pavement condition. This includes very poor or excellent samples that are not typical of the section and sample units, which contain an unusual distress such as a utility cut. If a sample unit containing an unusual distress is chosen at random it should be counted as an additional sample unit and another random sample unit should be chosen. If every sample unit is surveyed, then there are no additional sample units.

2.1.2 **asphalt concrete (AC) surface**—aggregate mixture with an asphalt cement binder. This term also refers to surfaces constructed of coal tars and natural tars for purposes of this practice.

2.1.3 **pavement branch**—a branch is an identifiable part of the pavement network that is a single entity and has a distinct function. For example, each roadway or parking area is a separate branch.

2.1.4 **pavement condition index (PCI)**—a numerical rating of the pavement condition that ranges from 0 to 100 with 0 being the worst possible condition and 100 being the best possible condition.

2.1.5 **pavement condition rating**—a verbal description of pavement condition as a function of the PCI value that varies from “failing” to “excellent” as shown in Fig. 1.

2.1.6 **pavement distress**—external indicators of pavement deterioration caused by loading, environmental factors, construction deficiencies, or a combination thereof. Typical distresses are cracks, rutting, and weathering of the pavement surface. Distress types and severity levels detailed in Appendix X1 for AC, and Appendix X2 for PCC pavements must be used to obtain an accurate PCI value.

2.1.7 **pavement sample unit**—a subdivision of a pavement section that has a standard size range: 20 contiguous slabs (± 8 slabs if the total number of slabs in the section is not evenly divided by 20 or to accommodate specific field conditions) for PCC pavement, and 2500 contiguous square feet, ± 1000 ft² (225 ± 90 m²), if the pavement is not evenly divided by 2500 or to accommodate specific field conditions, for AC pavement.

2.1.8 **pavement section**—contiguous pavement area having uniform construction, maintenance, usage history, and condition. A section should have the same traffic volume and load intensity.

2.1.9 **portland cement concrete (PCC) pavement**—aggregate mixture with portland cement binder including nonreinforced and reinforced jointed pavement.

2.1.10 **random sample**—a sample unit of the pavement section selected for inspection by random sampling techniques, such as a random number table or systematic random procedure.

¹ This practice is under the jurisdiction of ASTM Committee B17 on Vehicle-Pavement Systems and is the direct responsibility of Subcommittee B17.42 on Pavement Management and Data Needs.
Current edition approved June 1, 2011. Published July 2011. Originally approved in 1999. Last previous edition approved in 2009 as D6433-09. DOI: 10.1520/D6433-11.

Data Collection Specs

- ❑ At least 528 ft straight and level road section, with in **0.05 percent** of true length.
- ❑ Elevation accuracy within **0.001 in.**
- ❑ Perform calibration in a **monthly basis.**

Crowdsourcing

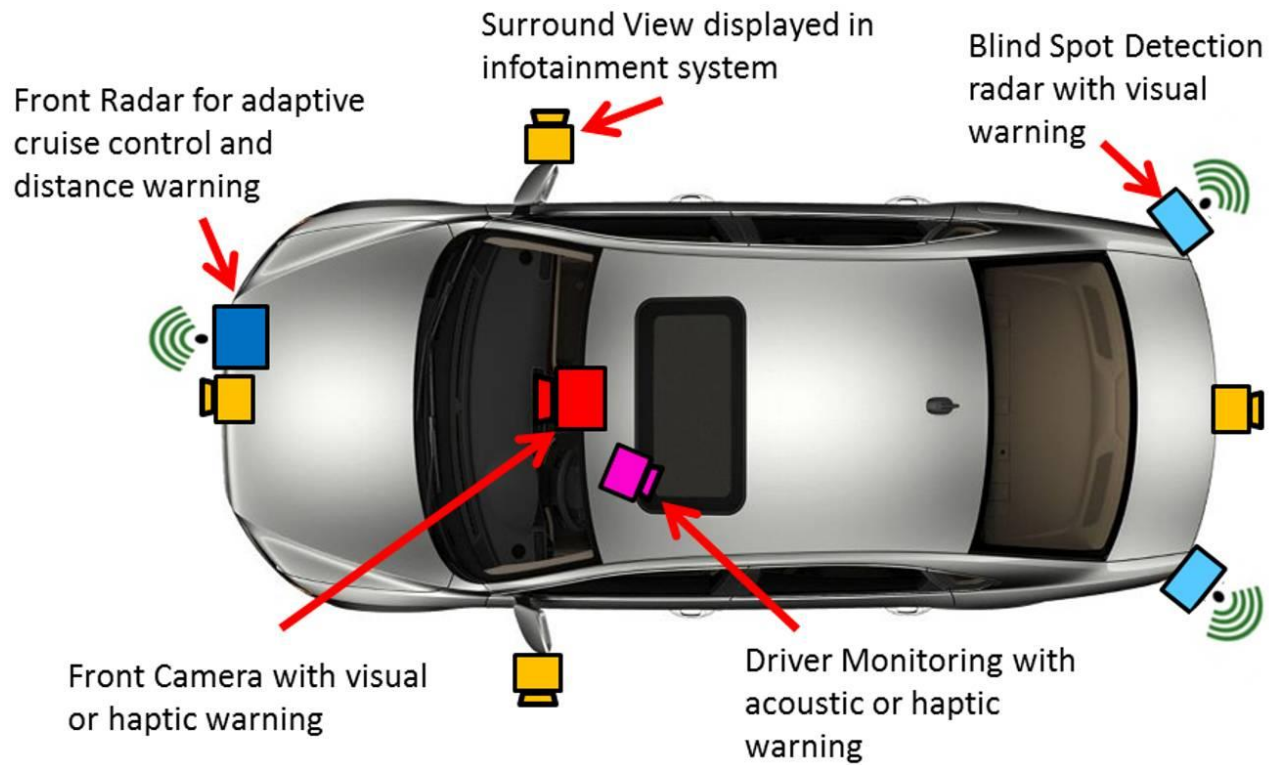

Motivation

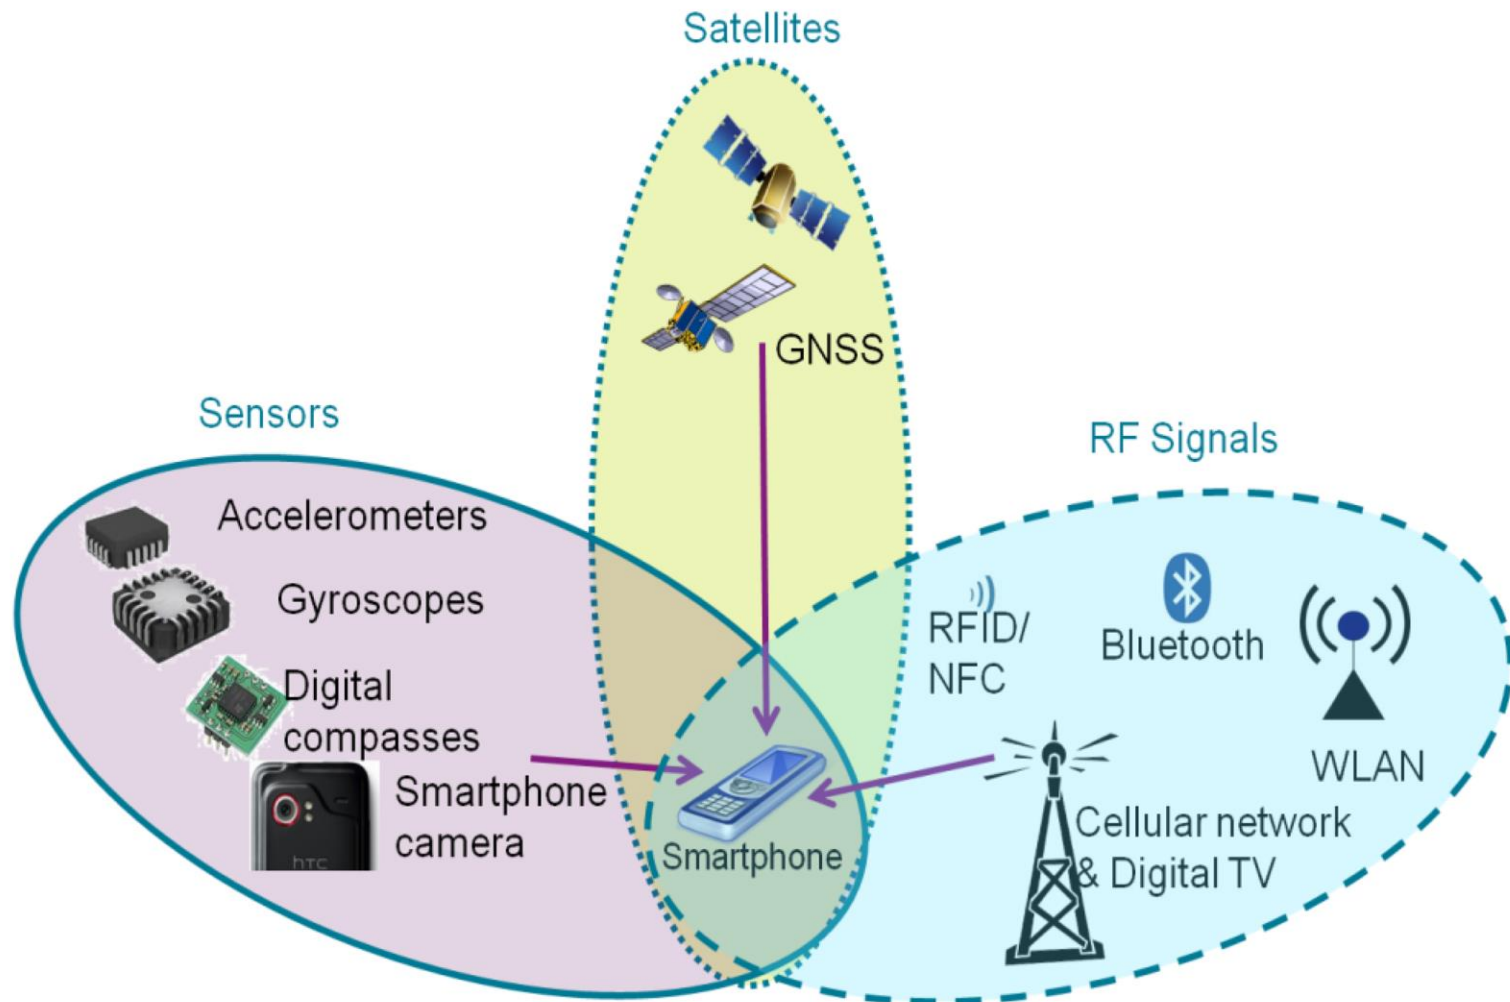

Data Collection

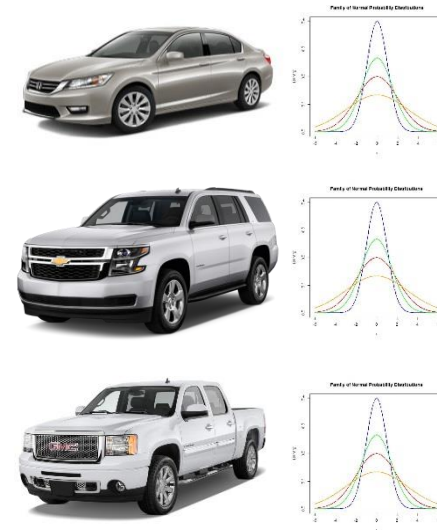

- ❑ **Single** lane condition survey.
- ❑ Most local agencies can **not afford expensive** equipment.
- ❑ Is **time consuming** and expensive.
- ❑ Can we use **smartphones** or **portable devices** to accurately assess pavement condition?
- ❑ How can we **integrate** this crowdsourced information into a **pavement management system**?
