

# Biogeotechnical Solutions for Mitigation of Fugitive Dust and Erosion Control

by

Edward Kavazanjian, Jr., Ph.D., P.E., D.GE, NAE

Ira A. Fulton Professor of Civil Engineering

School of Sustainable Engineering and the Built Environment

Arizona State University

at

11<sup>th</sup> Arizona Pavements and Materials Conference

20 November 2014

# What is Biogeotechnical Engineering?

Emerging sub-discipline in geotechnical engineering, including:

Bio-mediated processes: Managed and controlled through biological activity (living organisms)

Bio-inspired processes: Biological principles employed to develop new, abiotic solutions (no living organisms)

# Example: Carbonate Precipitation

MICP: Microbially induced carbonate precipitation

- A bio-mediated process

EICP: Enzyme induced carbonate precipitation

- A bio-inspired process

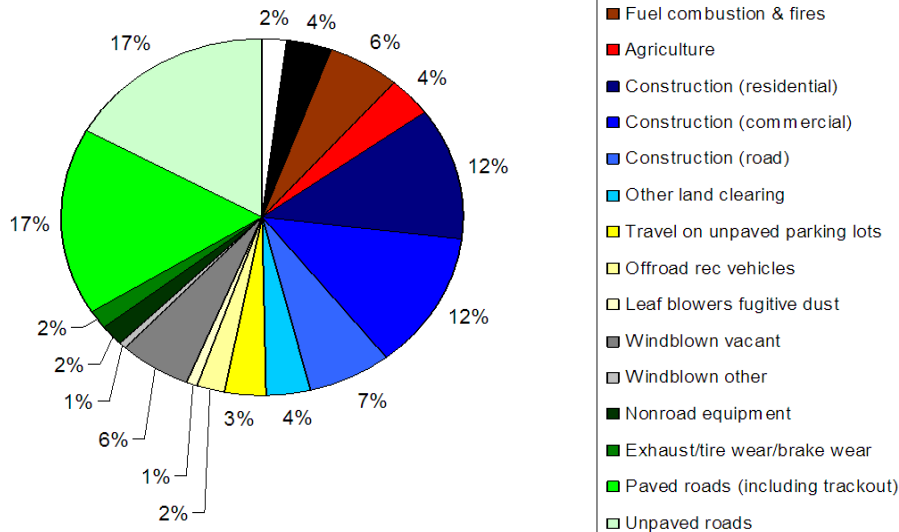

# Wind Erosion (Fugitive Dust)

## Phoenix: Air-quality non-attainment zone

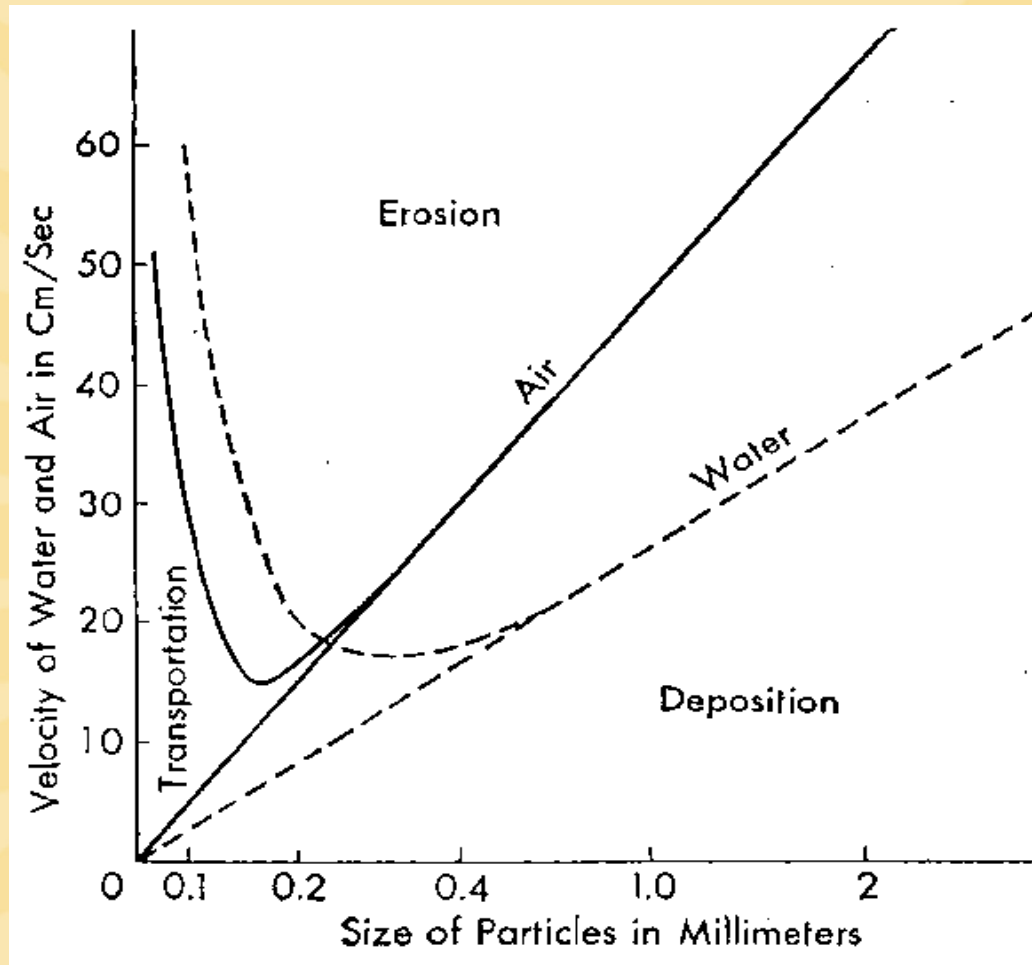

- Due to wind-blown soil (not vehicles or industry)
- Serious health problem
- Potential loss of highway funds (\$8 billion)
- \$5.3 Million in penalties issued in 2007
- Plagues many other areas

# Fugitive Dust Emission Sources

**Figure ES-4**  
**2007 PM-10 Emissions**  
**with Committed Control Measures**  
**Total = 97,436 tons/year**

# Erosion Susceptibility

Source: Garrels, 1951

# Traditional Dust Control

Water, salt solutions

# Biogeotechnical dust control

## Advantages:

- “One and done” (but for how long?)

## Disadvantages

- Cost
- Environmental impact

# Biogeotechnical Options

## Biopolymers

- Kavazanjian et al. (2009): Xanthan gum
- Chen et al. (2014): Xanthan gum, guar gum

## Carbonate precipitation via ureolysis

- Bang et al. (2011): MICP and EICP
- Hamdan (2014): EICP

# ASU/NASA Planetary Wind Tunnel

# Soils Tested

## Arizona silty sand

- Well graded,  $d_{50} \approx 0.2$  mm, 30% < #200

## Ottawa F-60 sand

- Poorly graded,  $d_{50} \approx 0.15$  mm, 0% < #200

## Mine tailings

- Well graded,  $d_{50} \approx 0.22$  mm, 10% < #200

# Biopolymers/Biofilms

## Biopolymers:

- Polymer Biomolecules
- Covalently bonded monomers
- Polynucleotides, polypeptides, polysaccharides

## Biofilms :

- *Aggregate* of microorganisms within a biopolymer matrix
- Adhered to each other and/or to a surface.

# Biopolymers/Biofilms (2)

Biofilm growth:

- A bio-mediated processes

Biopolymer spray or mix and compact:

- Bio-inspired application

# Candidate Biopolymers

Selection Criteria	Xantahn	Guar	Chitosn	PGA	PHB
Water soluble	X	X		X	
Readily available	X	X	X		
Extensive literature on properties	X	X	X	X	X
Price per gram (compared to other biopolymers)	X	X	X		
Ease of application (no special equipment needed)	X	X	X		

# Spray Application

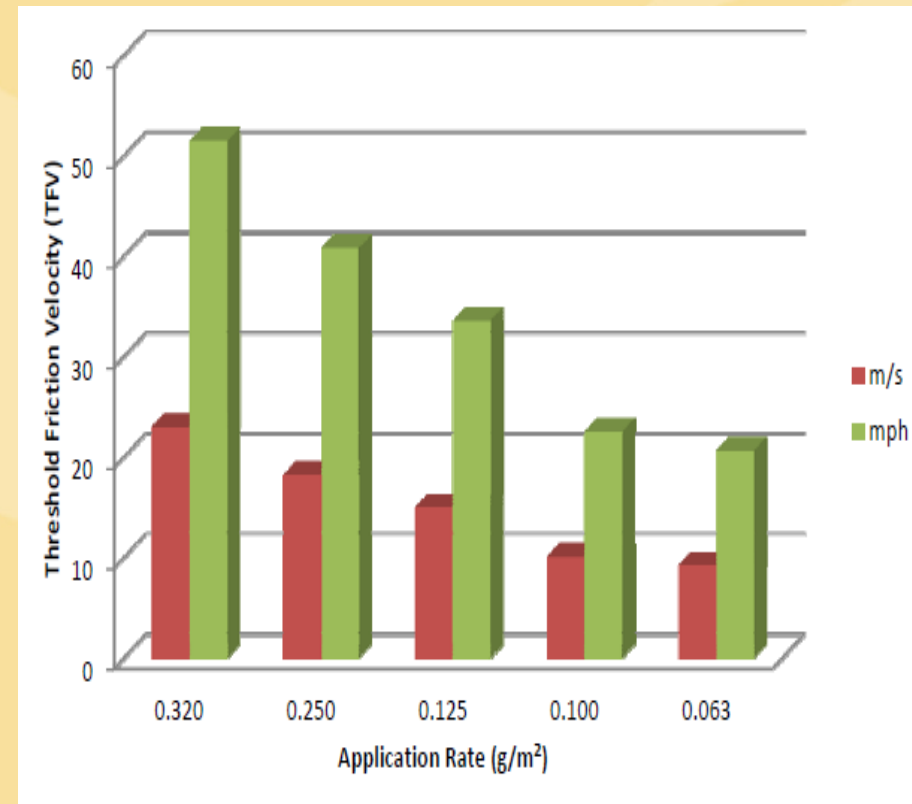

# Biopolymer Erosion Control

## ASU/NASA Planetary Wind Tunnel Testing

Xanthan Gum Treated Samples

### Untreated Samples

# Carbonate Precipitation

## Several mechanisms

- Ureolysis (hydrolysis of urea) most studied

## Enzyme urease catalyzes the reaction

- Urea<sub>(aq)</sub> speciates into  $\text{CO}_3^-$ ,  $2\text{NH}_4^+$
- $\text{CaCO}_3$  precipitates in the presence of  $\text{Ca}^{2+}$ , alkaline pH

# TU Delft MICP Tank Test (van Paassen et al.)

# EICP

## Ureolysis w/ agricultural urease

- Common in beans, melons, squash
- Jack bean (*C. ensiformis*) most studied

# EICP Columns (ASU)

100-mm dia. lab columns

275-mm diameter, 19 liter bucket test  
w/ 50-mm diameter perforated pipe

# EICP or Dust control

## Two-part mixture

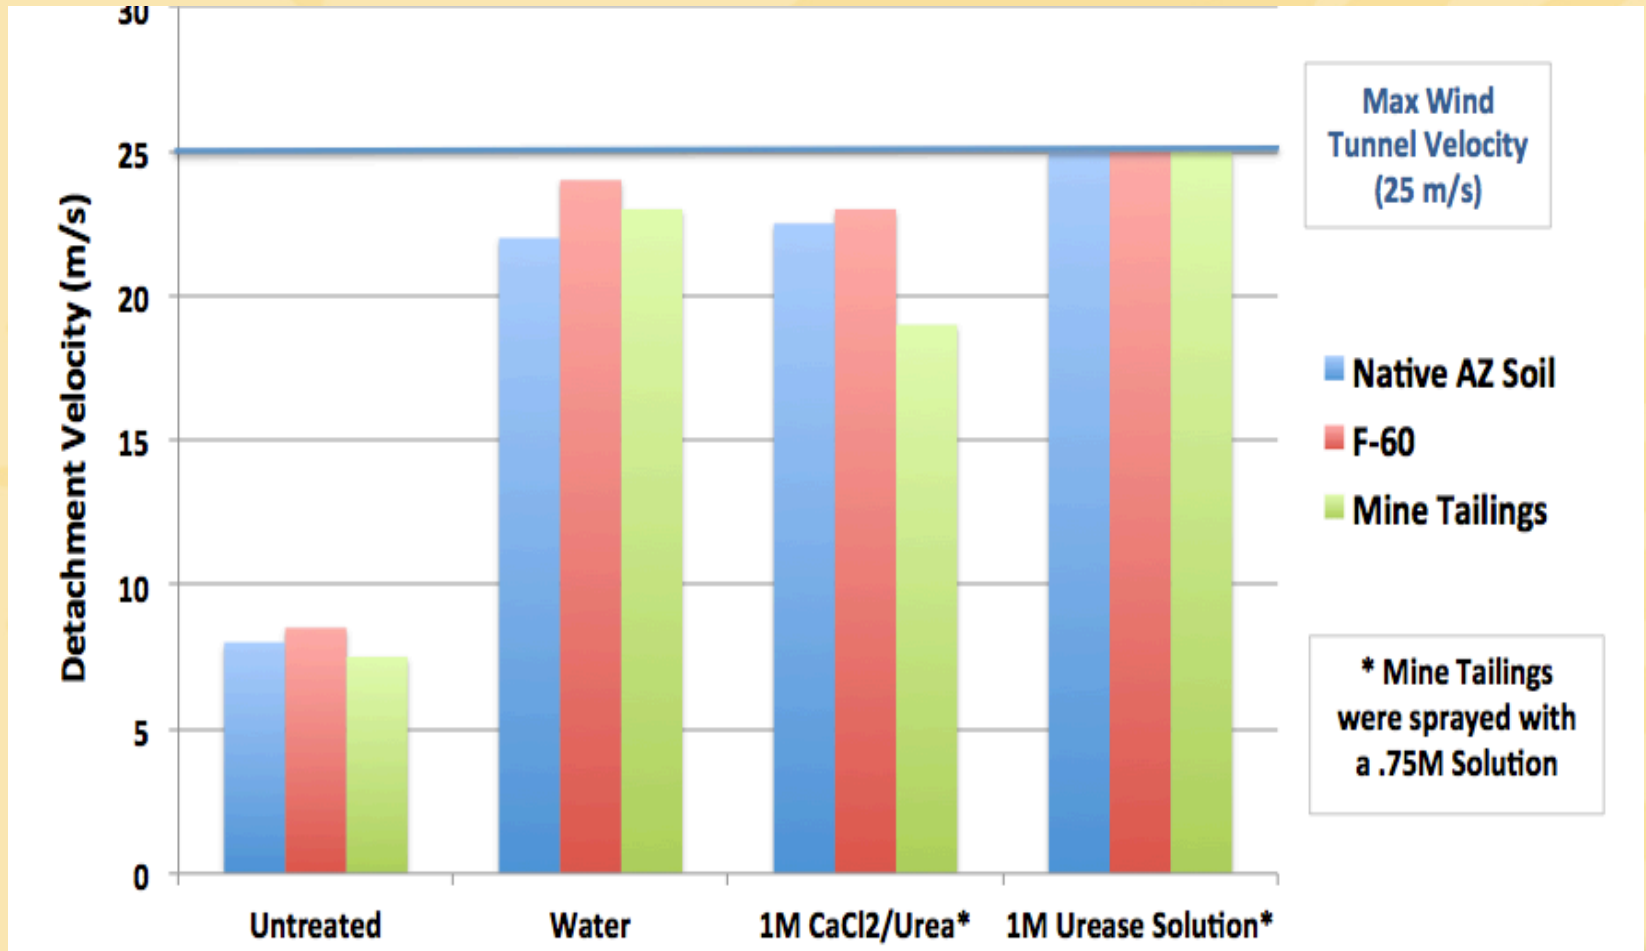

- Part 1: Urea and  $\text{CaCl}_2$  in solution
- Part 2: Urease in solution

## Applied simultaneously (by spraying)

- Forms a cemented crust

# EICP Treated Samples

# Surface Water Erosion Resistance

**Control, no  $\text{CaCO}_3$**

**$\text{CaCO}_3$  crust**

**Collected water runoff  
Control (left),  $\text{CaCO}_3$  (right)**

# Enhanced Erosion Resistance

Mix and compact cementation with soil

- Resistance to surface water
- Stabilize low volume roads

# Other Biogeotechnical Applications

Soil and groundwater remediation

Soil improvement

Liquefaction mitigation

Surface and subsurface barriers

Sequestration of contaminants

Alternative to Portland cement

Corrosion control

# Issues to Consider

Cost

Permanence/reversability

- Reversability may be beneficial in some applications

Energy consumption

Environmental impacts

Unanticipated side effects

# Conclusion

Fugitive dust control: One of many potential biogeotechnical applications

Many more waiting to be discovered

DeJong et al. (2011)
